COMPETITIVE AUDIT REPORT

RiskLens Technologies - Project 1A

Public-source review of institutional portfolio and risk analytics products.

Document control	Value
Version	1.0 - research draft
Research checked	9 October 2026
Competitors reviewed	Bloomberg PORT; MSCI RiskMetrics RiskManager; Axioma Risk / Portfolio Analytics
Primary method	Official product pages + publicly accessible visual references
Primary design source	RiskLens Figma file: https://www.figma.com/design/xDDU1m6ZtyvMkoeFlhv4wh
Intended use	Identify documented capabilities and reusable UX patterns for RiskLens

Evidence boundary. This report separates facts stated by vendors from design interpretation. The review used public product pages and published visual references; it did not use logged-in trials, customer-only product access, or hands-on accessibility testing.

Screenshot handling: the accompanying HTML gallery contains linked public visual references. This PDF records the direct image/page links and annotations; screenshot binaries could not be fetched into the offline PDF builder, so the PDF does not claim to contain embedded screenshot captures.

1. Executive summary

Three established products were reviewed against RiskLens' core problem: make complex portfolio risk understandable, traceable and actionable for multiple professional roles.

Platform	Documented center of gravity	Most relevant pattern for RiskLens
Bloomberg PORT	Portfolio, risk and performance in connected workflows; attribution; multi-asset models; scenario analysis; scheduled reporting.	Dense, cross-linked analytical workspace with coordinated tables, charts and reports.
MSCI RiskMetrics RiskManager	Enterprise risk engine and web application covering VaR, factor risk, stress testing, liquidity and counterparty credit risk, plus regulatory reporting.	Risk decomposition with visible drivers and multiple levels of analysis.
Axioma Risk / Portfolio Analytics	Time-series and point-in-time risk, factor/asset attribution, stress testing and integrated reporting; API-first delivery for Axioma Risk.	Risk-driver analysis, scenario comparison and repeatable reporting.

What the public evidence supports

All three vendors describe risk measurement alongside explanation or decision support; they are not just collections of headline KPIs. Attribution, scenario analysis and reporting recur across the product set. That makes the path from risk signal to cause to next action a useful comparison axis for RiskLens.

What cannot be concluded from these sources

Public pages do not provide a complete view of each authenticated interface. They do not establish how every product performs in real-world usability tests, whether its current web UI passes WCAG 2.1 AA, or whether specific responsive layouts are available. Those points are treated as unverified rather than inferred as product defects.

Recommended RiskLens direction

Keep the current Glance Investigation Deep Dive model, but make the connecting context persistent: portfolio, confidence, horizon, methodology, as-of time, severity and evidence. Add clear next actions at the point a risk change is identified.

2. Research method and interpretation rules

The Zetheta brief calls for a screenshot gallery, strengths, weaknesses, unique UI patterns, accessibility gaps, a feature comparison matrix, pattern library and opportunity-gap analysis. This report covers the public-source research and marks visual capture as a follow-up.

Sources and review scope

Bloomberg PORT: official Portfolio & Risk Analytics product page and a publicly listed reporting/analytics image [1, 2]. MSCI: official RiskMetrics RiskManager and broader risk-management product pages, plus a public MSCI Risk Insights dashboard image used only as a visual reference [3-5]. Axioma: official Axioma Risk and Portfolio Analytics pages, plus the public Axioma Equity Risk Monitor chart page [6-9].

Evidence labels

Label	Meaning
Vendor-stated	Explicitly described on a current official product page or official product material.
Observed in public visual	Visible in a publicly accessible screenshot or chart page; limited to what the visual actually shows.
Design interpretation	A UX implication inferred from product descriptions or the public visual, not a verified usability finding.
Not established	The sources reviewed do not provide enough evidence to answer the question.

Limitations

No customer login was available. No expert review of a live production instance was performed. No browser, keyboard, screen-reader, contrast or responsive tests were run on competitor products. Visual references may represent selected views rather than the complete product. Therefore, 'weaknesses' are expressed as design risks or research questions where the source does not prove a defect.

3. Bloomberg PORT

Official source: Bloomberg Portfolio & Risk Analytics (PORT). Bloomberg describes PORT as connecting positions, risk and performance, with analytics for investment decision-making across teams.

Capabilities explicitly stated by Bloomberg

Area	Publicly documented capability
Portfolio view	Unifies positions, risk and performance in one place; supports firm-wide analytics through PORT Enterprise.
Risk modelling	Multi-asset risk models and portfolio construction tools for equities, fixed income, commodities and alternative assets, including private markets.
Attribution	Customizable performance-attribution tools to show sources of returns and outperformance.
Scenarios	Four scenario-analysis categories: factor-based, full-valuation, macroeconomic and climate.
Workflow and reporting	Reporting templates, batch/scheduled delivery, workflow orchestration, imports and data validation.
Integration	Flexible API infrastructure and integration of Bloomberg and third-party data/indices.

Public visual reference

The linked portfolio-reporting visual presents a dark analytical workspace with tabular return/attribution values and compact charts. The visible pattern is high information density with aligned numeric columns and multiple linked analytical views. This is an observation of the published visual, not a full usability review.

Open Bloomberg public visual reference | Official PORT product page

Strengths relevant to RiskLens

Broad portfolio/risk/performance context; attribution linked to portfolio analysis; multiple stress-testing approaches; and reporting automation are explicitly documented.

Design risk / question to test

The published dense, multi-panel visual may suit expert users but could be difficult for occasional users without progressive disclosure and clear action hierarchy. This is a design hypothesis, not a claim that Bloomberg users experience a proven usability problem.

4. MSCI RiskMetrics RiskManager

Official source: MSCI RiskMetrics RiskManager. MSCI describes it as a scalable, hosted enterprise solution powered by the RiskMetrics calculation engine.

Capabilities explicitly stated by MSCI

Area	Publicly documented capability
Core risk measures	Value-at-Risk (VaR), factor analytics and stress testing.
Other risk domains	Liquidity risk and counterparty credit risk.
Enterprise delivery	Hosted analysis, interactive web application, ready-to-use reports and APIs.
Governance	Regulatory risk reporting and delivery to data warehouses or third-party systems.
Risk decomposition	Time-series and factor methodologies for a multi-dimensional view of risk.
Data scale	The page lists coverage of approximately 22 million securities, 17,000+ risk factors, 7.9 million time series and 76,000+ benchmarks from about 70 vendors, as of February 2025.

Public visual reference

The linked MSCI Risk Insights image (not claimed to be the exact RiskManager authenticated screen) shows a summary metric row above a risk-decomposition table and charts for local excess-risk breakdown and top/bottom contributors. It provides a public example of hierarchy from portfolio summary into factor/driver details.

Open MSCI public dashboard image | Official RiskManager page

Strengths relevant to RiskLens

The documented feature set spans market, factor, stress, liquidity and counterparty risk, with API/reporting delivery and regulatory use cases.

Design risk / question to test

The public image shows many dense analytical elements in a single view. In RiskLens, a similar view should use hierarchy, stable units, explicit confidence/horizon labels and an accessible text path for charts. That is a design recommendation, not a verified weakness of MSCI's software.

5. Axioma Risk and Portfolio Analytics

The audit treats Axioma Risk and Axioma Portfolio Analytics as a related product set, but preserves the distinction between the risk-management platform and the reporting/attribution product.

Capabilities explicitly stated by SimCorp/Axioma

Area	Publicly documented capability
Risk measurement	Time-series and point-in-time risk; risk statistics tracked through time.
Risk attribution	Exposure and sources of risk at portfolio, factor, classification and asset levels.
Stress testing	Predictive, historical and correlated macroeconomic scenarios; full-repricing approach described on the Axioma Risk page.
Sensitivity / what-if	Macroeconomic factor sensitivities and what-if analysis of prospective trades/hedges are described in the product family.
Performance attribution	Factor-based and Brinson attribution described for Axioma Portfolio Analytics.
Reporting	Standard reports with PDF/Excel outputs; workflow and batch-report generation can be scheduled/automated.
Platform delivery	Axioma Risk is described as cloud-native and API-first, supporting interactive analysis and batch reporting.

Public visual reference

Axioma's public Equity Risk Monitor chart page presents a series of labelled analytical sections, including volatility and correlation hotspots, components of risk and risk-change decomposition. It is a published chart/report page, not a capture of the complete authenticated Axioma Risk application.

Open public Axioma Equity Risk Monitor | Official Axioma Risk page | Official Portfolio Analytics page

Strengths relevant to RiskLens

Risk decomposition is described from multiple perspectives; the product family connects risk analysis, performance attribution and reporting; and workflow integration/batch reporting are explicit themes.

Design risk / question to test

The public chart page is focused on individual analytical topics. RiskLens should ensure its own deep-analysis screens keep an obvious return path to the triggering portfolio or alert, so detailed charts do not become disconnected from the decision that prompted them.

6. Feature comparison matrix

A check mark means the reviewed public source explicitly documents the capability. 'Not established' means the pages reviewed did not provide enough evidence; it does not mean the competitor lacks the capability.

Capability	Bloomberg PORT	MSCI RiskManager	Axioma Risk / Analytics	RiskLens design implication
Portfolio, risk and performance context	Documented	Documented risk dashboard / reporting	Documented analytics + attribution	Keep headline posture tied to the same portfolio context.
VaR	Not established on page reviewed	Explicitly documented	Risk analytics described; specific VaR detail not on selected page	Label confidence, horizon, methodology, limit and timestamp.
Factor / driver attribution	Explicitly documented	Explicitly documented	Explicitly documented	Support portfolio factor asset drill-down.
Stress / scenario analysis	Factor, full valuation, macro, climate	Stress testing explicitly documented	Predictive, historical and macro; full repricing	Compare loss, worst-hit class and recovery context.
Liquidity / counterparty risk	Not established on page reviewed	Explicitly documented	Not established on pages reviewed	Keep the initial scope aligned to the current brief; do not imply unbuilt risk domains.
Performance attribution	Explicitly documented	Not the focus of page reviewed	Explicitly documented	Separate risk contribution from performance contribution.
Regulatory reporting	Not established on page reviewed	Explicitly documented	Regulatory use cases in product family	Compliance view needs event history and evidence.
API / system integration	API infrastructure stated	APIs and external delivery stated	API-first stated for Axioma Risk	Design for clear export/integration states; backend security is separate.
Scheduled / batch reports	Explicitly documented	Reporting/API delivery documented; scheduling not established on page reviewed	Explicitly documented	Keep report status, cadence and latest output visible.
Public accessibility conformance evidence	Not established	Not established	Not established	Do not infer pass/fail from marketing pages; test the actual interface.
Public mobile/responsive details	Not established	Not established	Not established	RiskLens must document its own breakpoint behavior.

Interpretation

The clearest overlap is risk-driver explanation, scenario analysis and reporting. The strongest differentiator for RiskLens is not a claim to have more analytics; it is a consistent decision path across four user roles, responsive layouts, explicit alert acknowledgement/evidence and accessibility requirements.

7. Public visual evidence gallery

These are source-linked examples suitable for review. Click the links to open the original public image or chart page. The captions describe what is visible; they do not imply access to a full private product instance.

01 · Bloomberg PORT - portfolio analytics / reporting	Source visual: official Bloomberg reporting/portfolio-analytics image. Observed pattern: dark workspace; numeric table; small chart modules; a high-density analytical composition. Open source image
02 · MSCI Risk Insights dashboard	Source visual: image served from MSCI's official domain. This is a visual reference from MSCI's broader risk-insights offering, not confirmed as the exact RiskManager screen. Observed pattern: summary KPI band; risk decomposition hierarchy; chart plus contributor tables; light dashboard canvas. Open source image
03 · Axioma Equity Risk Monitor	Source visual: official public chart/report page hosted by SimCorp. Observed pattern: labelled analytical sections for volatility, correlation, components of risk and risk-change decomposition. Not a full app capture. Open live chart page

Screenshot status

Source links are verified, but embedded image files were not imported into this offline PDF. The companion HTML reference gallery displays the public image URLs directly when opened with internet access. For strict rubric compliance, capture and embed dated screenshots with annotations before calling the screenshot-gallery requirement complete.

8. Reusable design-pattern library

Patterns below are abstractions drawn from documented capabilities and public visuals. They are not claims that a competitor uses identical markup, interaction logic or component architecture.

Pattern	Evidence source	Reusable design principle	RiskLens application
Portfolio snapshot	Bloomberg visual; MSCI public dashboard	Start with a small, aligned set of decision KPIs and preserve a clear summary hierarchy.	Executive Risk Overview and Portfolio Overview.
Risk decomposition	MSCI RiskManager; Axioma Risk	Move from aggregate risk to factor/classification/asset contribution.	VaR, CVaR and Portfolio Detail drill-down.
Chart + table pairing	Bloomberg and MSCI public visuals	Pair trend/relationship visuals with exact values and a textual interpretation.	Make charts scannable without losing numeric precision.
Scenario comparison	Bloomberg; MSCI; Axioma	Compare losses across named scenarios and show contextual benchmarks.	Stress Testing with scenario, loss, worst-hit asset class and recovery estimate.
Attribution across risk and return	Bloomberg PORT; Axioma Portfolio Analytics	Keep return attribution distinct from risk contribution while allowing cross-navigation.	Separate risk driver explanation from performance reporting.
Repeatable reporting	Bloomberg; Axioma Portfolio Analytics	Provide predictable report status, output history, and scheduling controls.	Reports screen with export status and audit-friendly metadata.
Multi-role decision view	Design interpretation from broad enterprise workflows	Keep shared portfolio context while varying information density by task/role.	Junior Analyst Senior PM and CRO/Compliance views.

Pattern selection rule

Reuse the underlying information relationship, not the competitor's visual styling. RiskLens keeps its own dark token system, cyan action treatment and role-aware disclosure while using patterns that support explanation and decision traceability.

9. Accessibility and public-evidence gaps

The brief asks for accessibility gaps as part of the competitive audit. Public marketing pages are insufficient to prove WCAG performance of a vendor's authenticated product; the findings below are therefore framed as evidence gaps and design checks for RiskLens.

Audit area	Public-source conclusion	RiskLens action
Keyboard navigation	No criterion-level keyboard evidence established from the selected product pages.	Test actual focus order, focus visibility, menus and dialogs on critical flows.
Screen-reader behavior	No screen-reader transcripts or semantics were established from these sources.	Provide accessible names/values and text summaries for every chart and risk state.
Contrast	Screenshots alone are not sufficient for a reliable full contrast audit; values may be compressed/rescaled.	Run actual token-by-token contrast checks on RiskLens, then verify rendered pages.
Responsive/mobile behavior	Public product pages reviewed do not establish the complete responsive behavior of authenticated applications.	Verify the 1440 × 900, 768 × 1024 and 375 × 812 compositions and intermediate widths.
Colour-only risk encoding	Public images show colour-coded charts, but the sources reviewed do not establish whether every state has a redundant label.	Always combine status colour with text, numeric context and accessible chart summaries.
Data freshness and context	Public material does not establish every in-product timestamp and model-context treatment.	Keep as-of time, methodology, confidence, horizon and portfolio context persistent.

Important distinction

“Not established” is not the same as “fails WCAG.” The report makes no competitor compliance accusation without test evidence. RiskLens' own accessibility audit should be grounded in the actual prototype/implementation and tool output, not competitor marketing claims.

10. Opportunity-gap analysis and design recommendations

The opportunities below connect the common market capability set to the specific RiskLens brief, not to unsupported claims that competitors lack these features.

Opportunity	User problem to solve	Recommended response in RiskLens	Priority
1. Persistent risk context	Users lose the portfolio or assumptions that produced a metric when drilling deeper.	Keep portfolio, confidence, horizon, methodology and as-of time visible through drill-down.	P1
2. Alert-to-evidence path	Acknowledgement alone is insufficient for audit-sensitive exceptions.	Place acknowledge, required comment/evidence and confirmation in one explicit flow.	P1
3. Role-aware hierarchy	A single dense screen can overload juniors and slow senior users.	Preserve a shared data model but tune density, defaults and report emphasis by persona.	P1
4. Scenario interpretation	A scenario loss needs context to support a decision.	Show scenario, portfolio impact, worst-hit asset class, limit status and recovery estimate together.	P1
5. Accessible data visuals	A chart can hide exact values or communicate state through colour alone.	Provide textual summaries, labels, patterns where helpful and accessible selected-point values.	P1
6. Explicit data freshness	Real-time-looking data can be misread without an as-of timestamp or refresh state.	Show last update and distinguish loading, stale, error and populated states.	P2
7. Report lifecycle	Users need confidence that the right report was generated and delivered.	Show report type, period, status, latest output and available export action.	P2
8. Responsive re-composition	Dense desktop tables do not translate directly to smaller screens.	Use stacked KPIs, prioritized data, key-value rows and focused chart detail instead of scaling.	P1

Recommended design direction

Continue with the current RiskLens Glance Investigation Deep Dive model. Strengthen transitions between those levels, make alert evidence a first-class workflow, and use role-based density and accessible chart summaries as differentiators. Avoid claiming superior analytics coverage without a comparable backend specification.

11. Comparative strengths, trade-offs and research backlog

This summary combines vendor-stated capabilities with design interpretation. It should be read as a shortlist for further hands-on research, not a definitive usability ranking.

Platform	Documented strength	Potential trade-off to validate	Open research question
Bloomberg PORT	Connected positions/risk/performance; attribution; multi-asset analysis; scenario coverage; scheduled reporting.	Public visuals are dense; evaluate whether the same view remains learnable without expert familiarity.	How do keyboard shortcuts, focus and role-specific workspaces behave in the live terminal?
MSCI RiskManager	Broad enterprise risk coverage including VaR, factor, stress, liquidity, counterparty and regulatory workflows.	Many analytics domains may create navigation depth; test how users move between summary and explanation.	How are permissions, audit trails and mobile/tablet breakpoints represented in the authenticated UI?
Axioma Risk / Analytics	Risk decomposition, scenario methods, performance attribution and report automation.	Specialized analytical views can be detailed; test how context is carried between chart/report pages.	How do live alert triage, keyboard interaction and role customization work in the full product?

Next research tasks needed for a final, screenshot-complete audit

1. Open the three source visuals and save dated image captures.
2. Add numbered callouts directly to each screenshot (summary hierarchy, drill-down, chart/table relationship, reporting action).
3. Inspect full product materials or demo access before making any authenticated UX claims.
4. If access is available, perform a structured keyboard/contrast/responsive review instead of inferring accessibility from images.
5. Revisit feature rows marked “Not established” as new evidence becomes available.

Completion status

Public-source competitor research and synthesis are completed in this draft. The strict screenshot-gallery requirement remains open until actual screenshot captures are embedded and annotated.

12. Source register

Official product pages are the primary evidence for capabilities. Visual sources are linked separately and labelled by their actual product/page context.

Research note

Product pages were reviewed on 9 October 2026. Product claims are summarized rather than quoted at length. Public images are used only as references to discuss visible design patterns; they do not establish the complete state of a vendor's product or its WCAG conformance.
